Tooltips

Tooltips display brief labels or messages

Resources

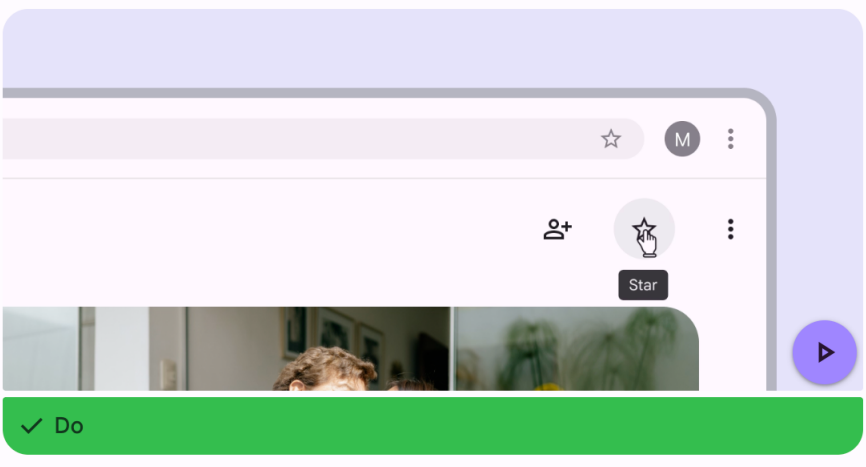
Use cases

People should be able to do the following using assistive technology:

- Receive a tooltip message
- Activate a tooltip with a keyboard or switch input

Interaction & style

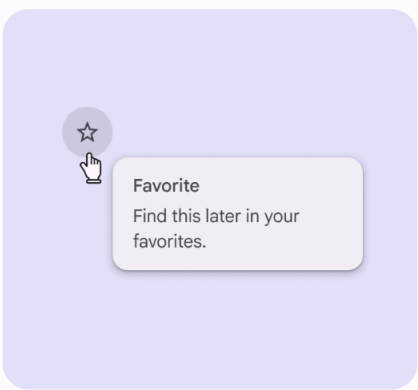
Plain and rich tooltips without required actions should remain on screen long enough for people to receive the information without disrupting their existing flow or task.



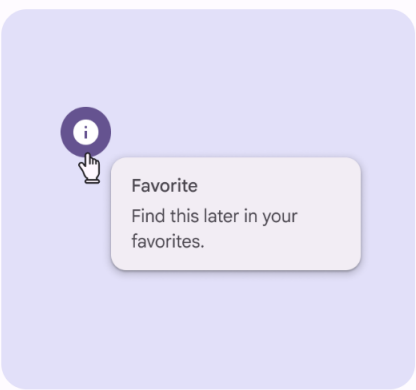
Plain tooltips should remain on the screen temporarily after the cursor moves away

Tooltips can appear when an actionable element, like a button or navigation rail, is hovered or focused. However, this tooltip shouldn't hide crucial information.

Rich tooltips can also appear by selecting an element instead of hovering or focusing on it.



Tooltips can appear on hover or focus to explain actions



Rich tooltips can appear when an element is selected

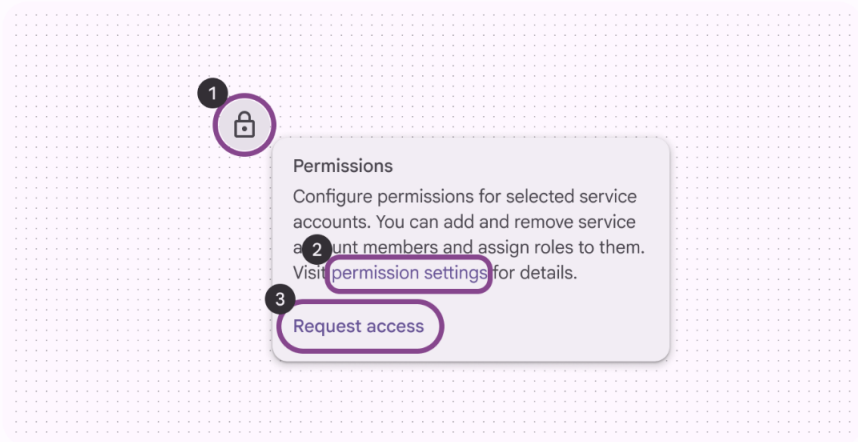
Focus order

Tooltip containers should not block important information or prevent a person from completing an action.

Focus order within the rich tooltip moves top to bottom between interactive elements.

Avoid trapping screen reader and keyboard focus on rich tooltips.

People should be able to move linearly through the rest of the page.



1. Parent element
2. Inline link
3. Text button

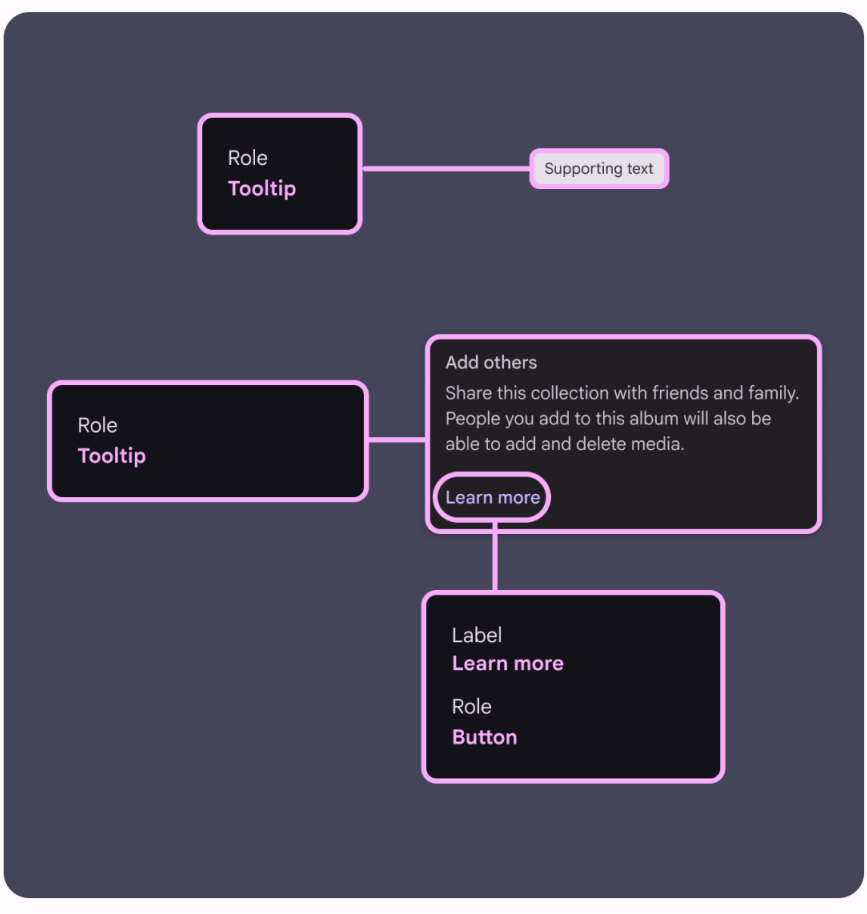
Keyboard navigation

Keys	Actions
Tab	Focus lands on button, if available
Space or **Enter**	Activates the focused element

Labeling elements

Tooltips should have the **Tooltip** role, or similar.

Label all elements in the tooltip according to their own accessibility guidance.



The tooltip container should have the **Tooltip** role
