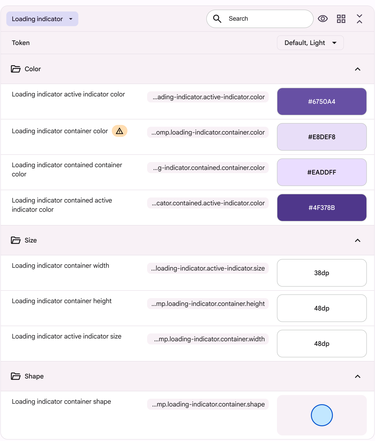
Tokens & specs

Loading indicators have a single token set.



Anatomy

1 Active indicator

2 Container

Color

Default

Color values are implemented through design tokens. For designers, this means working with color values that correspond with tokens; in implementation, a color value will be a token that references a value.

Loading indicator color roles used for light and dark schemes:

1 Primary

Contained

Contained loading indicator color roles used for light and dark schemes:

1 On primary container

2 Primary container

Measurements

To ensure sufficient margins, the size is 48dp while the shape container is 38dp
