Typography

Use typography to make content readable and beautiful

Applying type

The Material 3 type scale organizes styles into five roles that are named to describe their purposes: display, headline, title, body, and label. Each role has three sizes, large, medium, and small. These roles and sizes create clear page hierarchy and work across many devices.

Roles

Display

There are three display styles in the default type scale: large, medium, and small. As the largest text on the screen, display styles are reserved for short, important text or numbers. They work best on large screens.

For display type, consider choosing a more expressive font, such as a handwritten or script style.

If available, set the appropriate optical size to your usage.

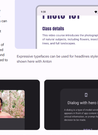
Headline

Headlines are best suited for short, high-emphasis text on smaller screens. These styles can be used for headlines on pages or for short, important regions of content.

Headlines can also use of expressive typefaces, provided that appropriate line height and letter spacing is also designed to maintain readability.



Expressive typefaces can be used for headlines styles as well, as shown here with Anton

Title

Titles are smaller than headline styles, and should be used for medium-emphasis text that remains relatively short and concise. Using title styles to divide secondary passages of text or secondary regions of content is appropriate.

For titles, use caution when using expressive fonts, including display handwritten, and script styles.

Body

Body styles are used for longer passages of text in your app.

Use typefaces intended for body styles, which are readable at smaller sizes and have comfortable spacing in long passages.

Avoid expressive or decorative fonts for body text because these can be harder to read at small sizes.

Body styles must be readable for long passages
